Candidates - one per line

white shirt
black shirt
blue shirt
red shirt

4 candidates | 0 duplicate lines

Equal chance for every unique candidate. Repeats are possible. Empty lines and duplicate lines are removed on save. Keys stay fixed after saving. Candidates may use `[[A|B]]`, but cannot reference other Wildcards.

Import TXT Export TXT Sample Delete Save

Edit candidates, then Save. The key stays the same.

Actual app screen. Match the button names in the steps below.

1. A Wildcard is a box of prompt choices. For example, tops can contain white shirt and blue shirt.
2. Each generation picks one candidate with an equal chance. Even a list with hundreds of entries uses the full list.
3. The same choice can appear again. Equal chance does not mean taking turns. This version uses independent random selection.

1. Create a Wildcard

The screenshot shows the Wildcard app interface. At the top, there is a dark blue header bar with the text "Tops / 상의". Below this, there is a section labeled "Reference key" with a text input field containing the word "tops". Below the input field, there is a label "Reference: __tops__". Below this, there is a large text area for candidates, containing the following text:

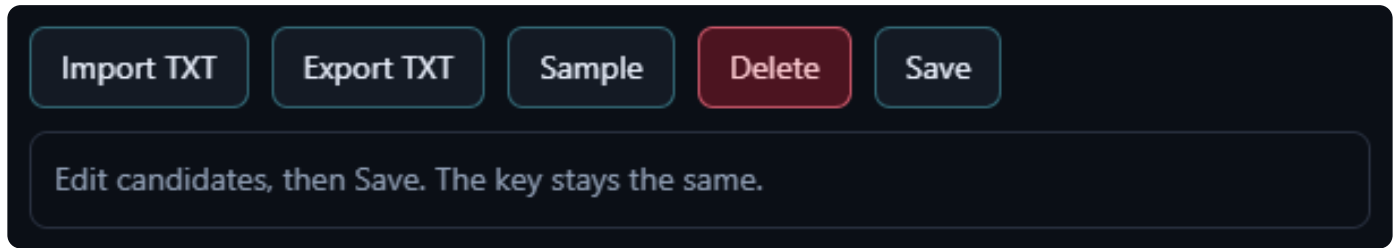

```
white shirt
black shirt
blue shirt
red shirt
```

At the bottom of the text area, there is a status bar that reads "4 candidates | 0 duplicate lines".

Actual app screen. Match the button names in the steps below.

1. Click Wildcards at the top, then + New Wildcard.
2. Use a friendly Name and a short Reference key, such as tops. Keys use lowercase letters, numbers, single underscores, or hyphens.
3. Write one candidate per line in Candidates. Put white shirt and blue shirt on separate lines.
4. Click Save. Empty and duplicate lines are removed. The saved key stays fixed; the name and candidates can change.

2. Manage a large list

Actual app screen. Match the button names in the steps below.

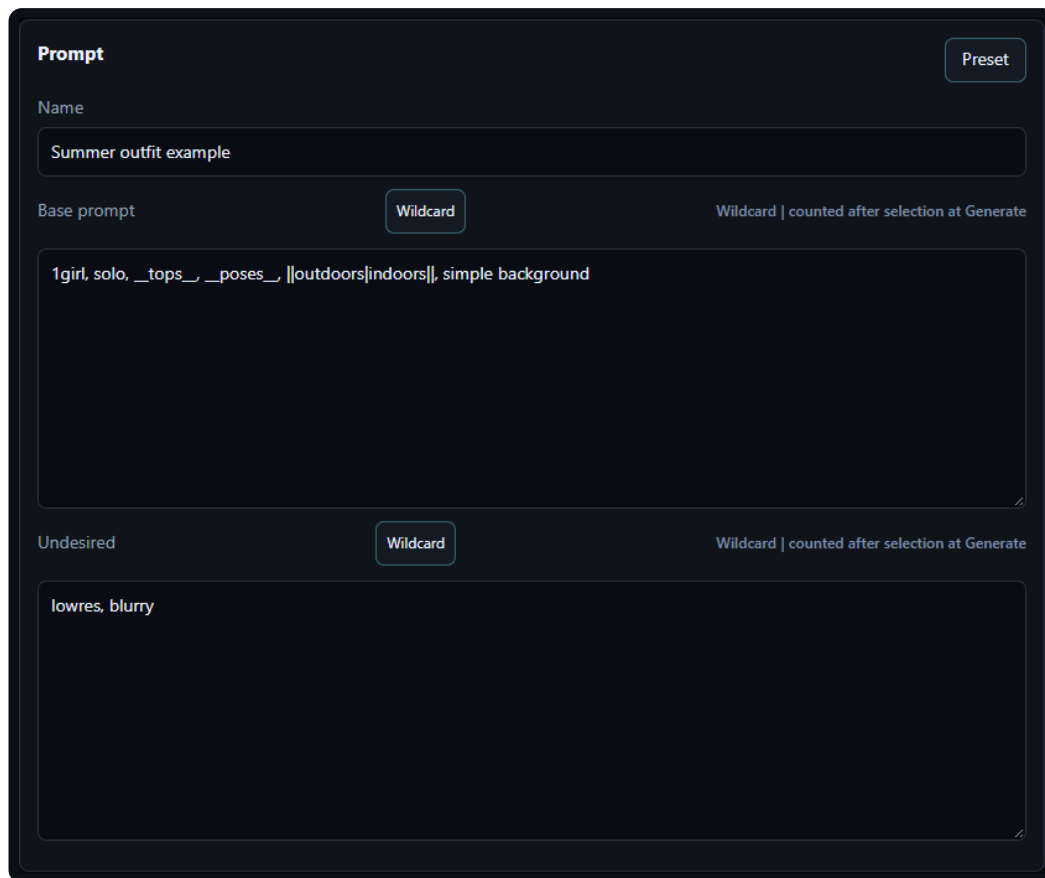

1. Select a Wildcard in the left list. Search finds a name or key.
2. Paste many lines at once, or use Import TXT for a UTF-8 text file. Click Save after importing.
3. Export TXT saves the current candidate text. Sample shows a practice choice; it does not lock the choice for generation.
4. Delete removes the box. Presets using its key need a replacement box or an edited reference before generating.

3. Insert it into a prompt

Actual app screen. Match the button names in the steps below.

1. Place the cursor where you want the reference in Base prompt. Click that field's Wildcard button.
2. Choose tops, then Insert into prompt. The app inserts `__tops__`. There are two underscores on each side.
3. Example: 1girl, `__tops__`, standing. You do not need to paste the whole candidate list.
4. Use the same method for Undesired or the active Character Prompt/Undesired tab. You can also type `__tops__` yourself.

4. Combine boxes and random blocks

Prompt Preset

Name

Summer outfit example

Base prompt Wildcard Wildcard | counted after selection at Generate

1girl, solo, __tops__, __poses__, ||outdoors|indoors||, simple background

Undesired Wildcard Wildcard | counted after selection at Generate

lowres, blurry

Actual app screen. Match the button names in the steps below.

1. Create tops for clothes and poses for poses. Try: 1girl, __tops__, __poses__, ||indoors|outdoors||
2. Each reference chooses independently. Two uses of __tops__ can choose different clothes.
3. A line such as white shirt, rolled sleeves is one candidate, including all its tags.
4. A candidate can use ||white shirt|blue shirt||. References to another Wildcard inside a candidate are not supported.

5. Save and generate

▼ Selected prompt for this request

Base: 1girl, solo, red shirt, walking, outdoors, simple background

Undesired: lowres, blurry

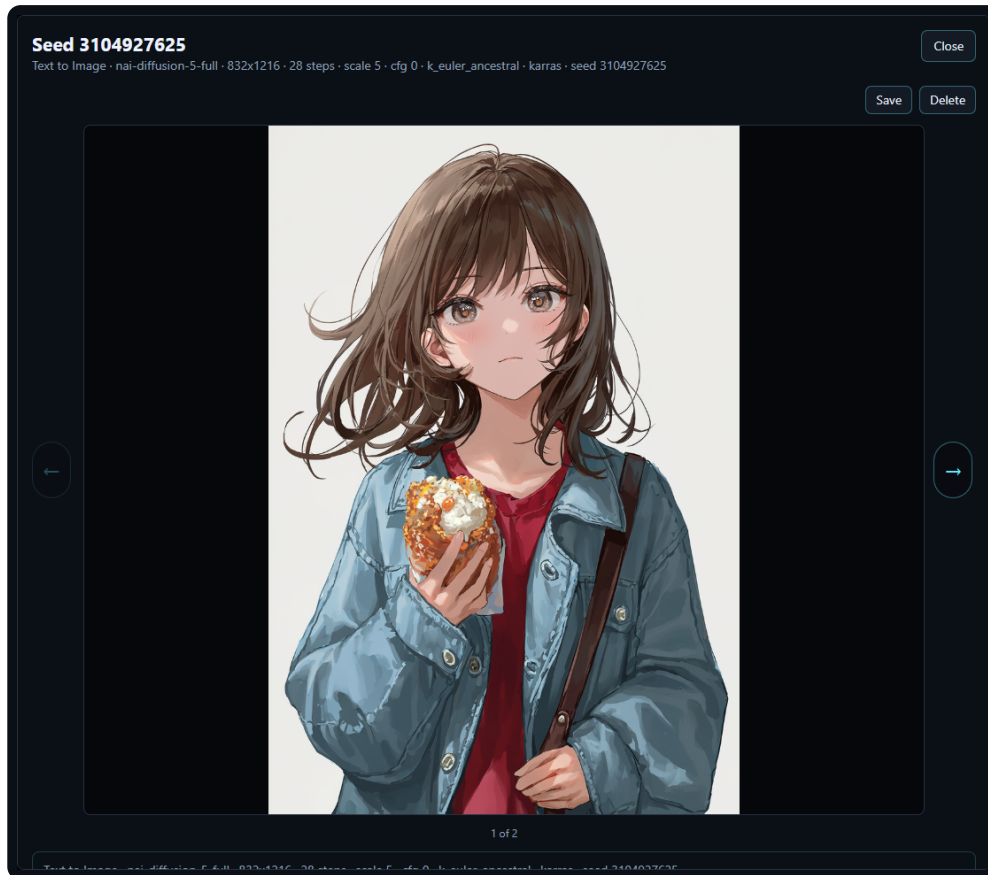

Character 1: brown hair, blue shirt

Undesired:

Actual app screen. Match the button names in the steps below.

1. Save or Save As in Current Preset stores the preset. References such as __tops__ remain in it.
2. Click Generate One Image. The app resolves the choices and existing random blocks before sending them to NovelAI.
3. Open Selected prompt for this request to see the chosen words. __tops__ remains in the editor for the next image.
4. Saved Wildcard edits apply to the next generation. A request already prepared keeps its original choices.

6. Check results and solve problems

Actual app screen. Match the button names in the steps below.

1. History and the image's NovelAI metadata keep the final prompt used for that image. They do not include the candidate library.
2. Loading History settings gives fixed values such as blue shirt. Load the original preset to choose randomly again.
3. For a missing or empty error, check the key spelling and whether you saved the list. Check letter case and both pairs of underscores.
4. When moving to another computer, bring each Wildcard TXT file with the preset. Create and save the same keys there. Reopen this guide from the version button.
